

# Osirium Automation Getting IT work done

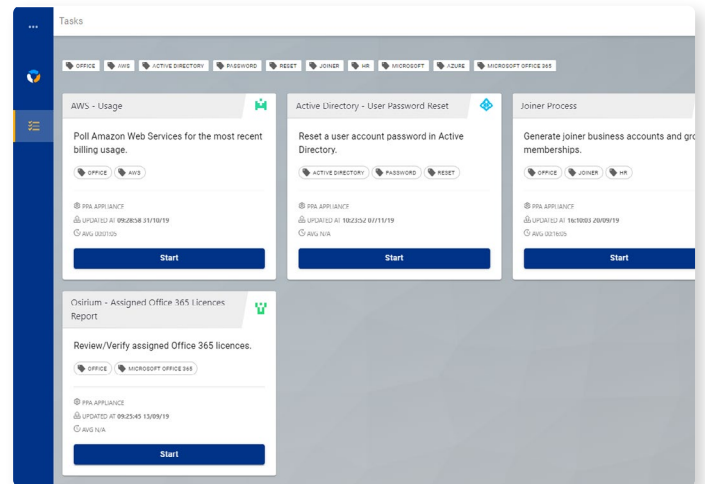

## What is Osirium Automation?

Osirium Automation is a unique solution for automating IT and business processes that traditionally require expert skills.

Its flexibility comes from the open, secure Privileged Process Automation (PPA) framework to automate workflows across systems via API, REST, SSH, or command lines.

By hiding the complexity and need for specialist technical knowledge, processes can now be securely delegated and accelerated.

Faster. Cheaper. More secure.

## Osirium Automation Benefits

### Automate IT Operations

- Save time spent on repetitive tasks like resetting passwords
- Perform routine service health checks in seconds not minutes or hours
- Delegate more tasks to the help desk

### Provide Better Service

- Solve more user requests on the first call
- Empower end-users for self-service
- Reduce manual errors and rework

### Improve Governance

- Ensure regulatory and corporate policies are enforced
- Provide rich audit trails when needed
- Delegate complex compliance tasks such as account re-certification

### Automate Anything

- Build new automations with the built-in low-code task builder
- Automation becomes cheap, so automate as much as you can
- Free, online repository of pre-built automated playbooks and plug-ins

## How Osirium Automation can help

### Cybersecurity

Too many users have too much privileged access to systems. Automate IT process and delegate them without compromising security.

### DevOps

DevOps teams never want their CI/CD pipelines to stop while waiting for IT to provision new dev or testing environments. Safely delegate SaaS and VM management to let them manage their own work.

### Governance

Remove the need to process dozens or hundreds of spreadsheets to prove compliance. Automate slow, manual governance processes such as account re-certification.

### Operations and Infrastructure

Top IT specialists are under constant demand for routine tasks. Automate and delegate work to let them focus on high-value tasks.

## An Open, Secure, and Flexible Framework

Osirium Automation is built on Osirium's Privileged Process Automation (PPA) framework to automate IT work.

- Credentials stored in secure vaults such as Osirium PAM or HashiCorp and always protected.
- Automated playbooks work with existing IT systems via a flexible plug-in framework which is ready for any changes that may come.
- Playbooks can include workflow and approval mechanisms via your preferred communications tools including email, Microsoft Teams or Slack.
- Integrate playbooks into existing service desk tools, such as ServiceNow, or corporate intranet portals.
- Schedule playbooks to run at specified times, ideal for repeated tasks such as backups or server health checks.
- Build playbooks using the internal, low-code Task Builder which includes versioning and validation tools.
- Free library of plug-ins and example playbooks in the [PPA Resource Hub](#).
- Full audit logs are maintained within PPA and your preferred SIEM logging systems such as Splunk.

## Typical Automation Examples

Osirium Automation is a flexible framework that can be used across a wide range of business and IT processes, such as...

## Osirium Automation Availability

Osirium Automation is available standalone and as part of Osirium PAM. It is supplied as a pre-configured virtual appliance for use with VMware vCenter or Microsoft Hyper-V. It is also available in both the AWS Marketplace and Azure Marketplace.

Automation licensing is subscription-based, per-user. Unlimited playbooks can be built and deployed. For integration with corporate portals or service desk systems, PPA API Credits are required. Pricing information is available on request from Osirium.
